Charakteristik

Veneers from the same flitch are slip-matched, with every second sheet rotated 180° along its longitudinal axis. Depending on the leaf width, this creates panels with uniform color and structure, while the rotation prevents a strong visual emphasis at the panel base. Each flitch develops its own distinct character, and variations in grain pattern, leaf width, or color may occur. On smaller surfaces, striping effects can become visible. Suitable for small ceiling and wall claddings with a horizontal grain direction.

Type of grading

Suitable project size

Continuous areas up to 30 m²

Attributes

- Harmonious structure flow
- Decorative, pronounced grain

Slip match, partially rotated (crown, from large format)
