Veneer 1

Veneer 2

Veneer 3

## Charakteristik

Veneers from the same flitch are slip-matched, with every second sheet rotated 180° along its longitudinal axis. With calm, color-homogeneous veneers, this results in balanced surfaces, while the consistent orientation of the veneer face prevents visual misalignment of the panels. Color differences within the sheet are reduced through the bonding of heartwood-to-heartwood and sapwood-to-sapwood sides, though they may be accentuated during lacquering. Under grazing light, striping effects may occur. Suitable for small wall and ceiling surfaces with a calm appearance and a subtle emphasis on the wood structure.

## Type of grading

## Suitable project size

Continuous areas up to 30 m²

## Attributes

- Harmonious appearance
- Accentuated wood texture

# Slip match, partially rotated (rift/quarter, from large format)
