Charakteristik

Veneers from the same flitch are slip-matched, with every second sheet rotated by 180°. Depending on the leaf width, this creates panels with a uniform color and structure, while the rotation prevents strong visual emphasis at the panel base. Each flitch develops its own unique character, and variations in grain pattern, leaf width, or color may occur. When light falls onto the surface from a shallow angle, striping effects can become visible. Suitable for small ceiling and wall claddings with a horizontal grain direction.

Type of grading

Suitable project size

Continuous areas up to 30 m²

Attributes

- Harmonious appearance
- More subtle visual effect
